			Total	$9.18

REQUIRED Business Purpose: Provide justification that clearly identifies how this purchase supports ASU and MSN and/or how the transaction directly

Six 100 microfarad (uF) 25 volt (V) low equivalent series resistance (ESR) capacitors to stabilize the 5 V regulator, three TO-220 heatsinks to cool it, and four 28-pin female headers to socket the microcontroller. Student Landon Kuhman, under Professor Vivek Thangavelu, will use these parts to build the Light Detection and Ranging (LiDAR) printed circuit board (PCB) for OpenField (Team 101), a student-built robot that paints field lines, in Robotics and Autonomous Systems (RAS) 304. This supports ASU's mission of hands-on engineering education. One-time purchase covering a breadboard prototype, the PCB, and spares.
